

To make a webpage

Open Notepad. All Windows computers come with Notepad.

Type in the webpage, following the example.

Click "File".

Click "Save As..."

Make sure it will save it somewhere you can find it, like the Desktop. Keep all your webpage files in the same place.

Enter a file name for your webpage.

Making a webpage file name:

One word is good. If it is more than one word, it cannot have spaces or punctuation.

The name must end like this: .html

Here are good names:

start.html

aboutme.html

johnsboats.html

To link properly, the page name must be the same as the name in the "href" of links that point to this page.

Change "Save as type" from "Text Documents" to "All files".

Click "Save".

To edit a webpage

Right-click it.

Click "Open with".

If you see Notepad, click on it. You can edit it now.

If you don't see Notepad, click "Choose default program..."

Uncheck "Use this app for all .html files".

Click "More options..."

Click Notepad. You can edit it now.

If you make changes when editing, save it in Notepad, then view it in your browser. If it is already open in your browser, click refresh to see your changes.

To view a webpage in your browser

Double-click it.

If it opens in Notepad instead of your browser:

First, click "File" and "Save As..." Make sure that its name ends in ".html", and that "Save as type" is "All files". Then save it again, and throw away the old broken file.

If it still opens in Notepad, right-click it, click "Open with", click "Choose default program...", make sure "Use this app for all .html files" is checked, and click your browser in the list.
